
Mosquitoes, honeybees and beneficial insects

Honeybees and other beneficial insects can be killed by adult mosquito spray programs. Fortunately, spraying is usually done at night when these pollinators are in their nests. Although the incidence of chance of residue is minimal, bee keepers should consider wiping down the surface of their hives to remove and residue that might have landed on the bee boxes.

If you do not want your property to be sprayed call the Bradford County Extension Office and asked to be put on the “DO NOT SPRAY” list.
